

Role of Data Standards in Quality and Harmonization

**Metadata and Data Standards for NIDDK
Research Data**

June 27th, 2023

Sanjay Jain MD, PhD

**Professor: Medicine (Nephrology), Pathology and
Pediatrics**

**Director: Kidney Translational Research Center
sanjayjain@wustl.edu**

 **Washington**
University in St. Louis

SCHOOL OF MEDICINE

 **HuBMAP**
Human BioMolecular Atlas Program

 **KPMP**

Objective: Create a high-resolution integrated single cell and spatial multimodal atlas of the human kidney in health and disease across lifespan

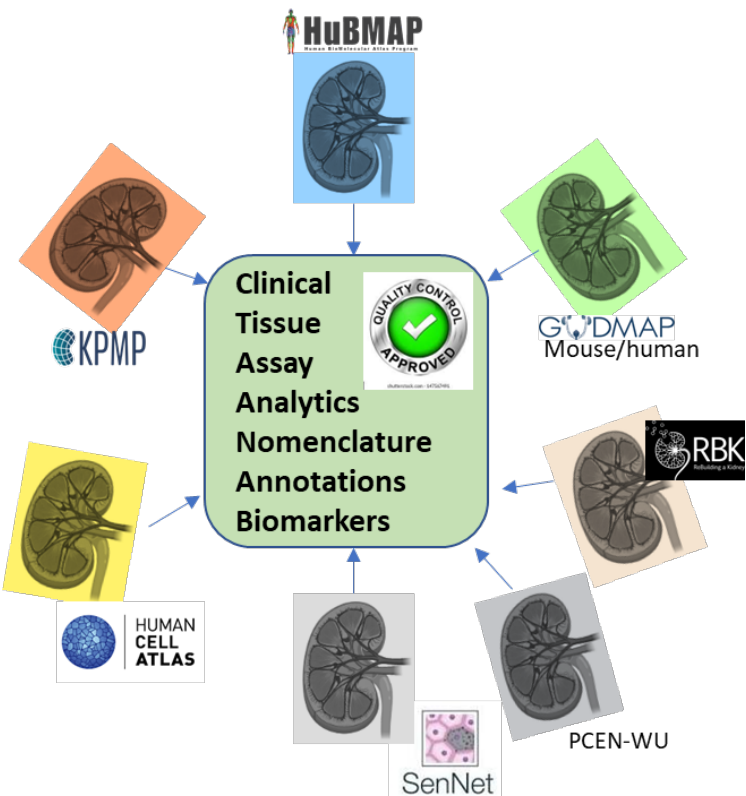

PCEN

A collection of morphological and molecular maps

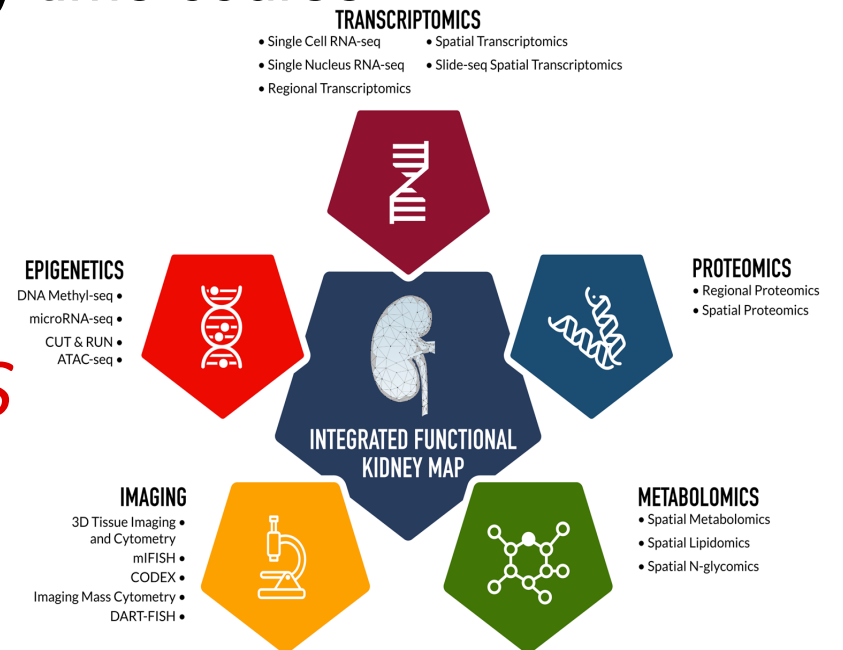

- understand vital functions of the kidney***
- create knowledge to prevent kidney injury and recover from it***

Overview

- Quality assurance and control
 - Follow the tissue pipeline
- Assay / Data Harmonization
 - Bridges across data types and rigor
- Examples showing cross-species integration
 - Cellular diversity and injury time course

*Many assays,
Many institutions*

Assay Integration and Data Harmonization

Assay and Analytic Standardizations: Metadata

Participant clinical data	Demographics, comorbidities, social history (alcohol, tobacco, rec drugs), active medication categories (diurectics, ACE/ARB inhibitors), general health prior to current circumstances							
Tissue quality	gross pathology, microscopic composition (%cortex, % outer and inner medulla, papilla, non kidney components), age appropriate glomerulosclerosis, eGFR > 60, HbA1C <6.5, mild to no tubulointerstitial changes							
Tissue data	warm ischemia (<30min Nx, Bx < 10min, Deceased donor <1h down time); cold ischemia time (<36h, perfused), Cold thaw cycles (-80 to -23 C), Storage temp tracking, quantity usage log							
Technologies	snRNAseq	snATACseq	smFISH	DART-FISH	10X Visium	CODEX	3D IF	Light sheet (LS)
Assay	nuclei > 1000; cDNA > 20ng; library size 200 – 1000bp		Instrument calibration Pass		RIN>7, Tissue affixment without folds or overlap, library size >400 bp	Visual tissue quality assessed via brightfield imaging (10X), adjacent PAS staining. Microscope QA with ArgoLight based microscope assessments (lamp or laser stability, SNR, resolution), labelled antibody lot testing.		Ab test each lot on Nx using confocal IF
Sequencing / Imaging	Q30 score > 80%; > 60% reads mapped; phiX spike (mapping errors, phasing/rephasing, reagents)		Housekeeping gene feature counts	RNA staining intensity, background baseline	Q30 score > 90%; Reads mapped to Exons >30%; image inspection	Signal quality (dynamic range), probe carry-over, artifact detection	Signal quality (dynamic range), spectral unmixing accuracy, SHG and autofluorescence imaging	Verification of clearing by confocal IF
Post sequencing cells, genes, clusters / imaging features	400>genes<7500 non mitochondrial	>1000peak count per cell<100,000	# features / mm2	10^4 rolonies / mm2	Reads >50% map to spots under tissue	Identifying ~3-10k cells per 1 mm2. Consistent segmentation and neighborhoods in reference tissue.		Confirm antibody penetration with prescan
	# cells (nuclei) passing QC > 100	fraction reads in peaks >0.2	# features / nucleus	5<#rolony<30 / nucleus	Fiducial alignment	Spatial, cell-type and neighborhood correlation between sequential sections of CODEX, 3D IF and 10X Visium.		
	minimum #cells to call a cluster - 30	>200 accessible peaks in >49 nuclei		2<#genes<20 / nucleus	reads/spot >20K	Nuclear segmentation (F1 score), cellular density and distribution on experimental tissue.		check for data loss post compression of raw data
	genes/cell QA > 500	TSS enrichment > 2	Fraction decoded	60% rolonies decoded	genes/spot QA > 500			
	doublet detection rate QA < 10%		# features / spot / gene	# features / spot / gene	Total genes detected >10K			
	# clusters or cell types > 5		Nuclear segmentation	Nuclear segmentation, poly-T (total cDNA)	# clusters or cell types mapped > 5	cell type classification/cluster prediction (Silhouette analysis, Elbow plots)		
Assay drift controls	Nephrectomy tissue every 8th run, L-J plots		Nx every run, house keeping genes		house keeping genes	Image intensity, segmentation and classification of Nx tissue visualized with L-J plots		psfs confirm clearing and instrumentation
Software used	Cellranger arc; HIVE snRNA-seq Pipeline	Cellranger arc; HIVE snRNA-seq Pipeline	Esper Spatial Studio software	in house python code	cloupe browser, R, giotto, vitessce	Leica LASX or CODEX processor and ImageJ with VTEA		Arevis, ZEN2 (Blue), Imaris, MFB
Data or file types	FASTQ	FASTQ		tif, tsv	FASTQ, BAM, tif	tif	tif, lif	CZI, JP2000, OME-TIFF, xml

Assay Performance Controls (**drift over time**)

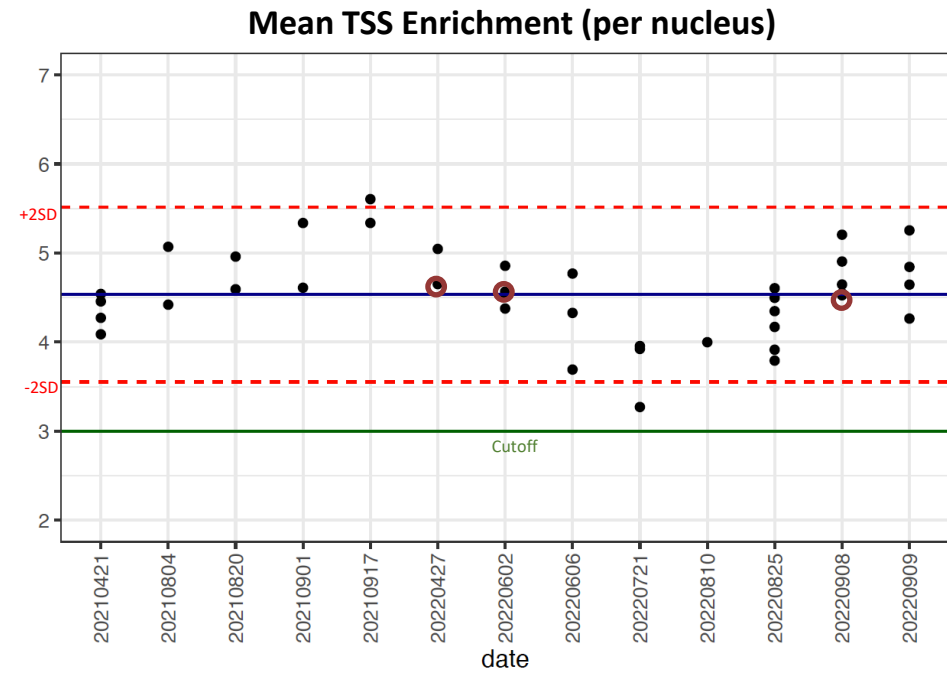

Multiome (RNA + ATAC):

229,780 nuclei
27 individuals
40 samples

○ QC Material D_080

Add a control sample every batch, or at any change in the pipeline

Experimental Design:
Assay QC
(Levey-Jennings plots)
(Multiome Only)

Assay and Analytic Standardizations: Cell Nomenclature (ASCT+B Tables)

Integrated Atlas across Technologies, Institutions and Consortia

Data supported definitions: How to identify healthy cells?

Mature Functional State

Altered state Dedifferentiation

Transporters
UMOD, EGF, ESRRB TF

EMT genes
TGF- β /SMAD pathway
MAPK (JNK) pathway
JAK/STAT pathway
Rel/NF-kB pathway
EGF/Wnt/Notch pathways

Not healthy reference degenerative / damaged / dysfunctional

marked loss of differentiation markers, and/or increased %ERT, %MT, and/or marked decrease in genes detected. These cells could represent an early injury state or cells that will not recover function due to severe injury

adaptive / activated - stromal

represented by cells that are differentiating or have differentiated into high ECM producing myofibroblasts or activated fibroblasts

adaptive / successful or failed repair - epithelial injury

represented by cells that retain differentiation markers of reference states, albeit at lower levels, but also show expression of known injury associated genes, mesenchymal markers or factors promoting inflammation or fibrosis

An atlas of healthy and injured cell states and niches in the human kidney
